                                                                                                                                                                                                                                                                                                                                                                    Cloning of a full-length cDNA encoding bovine thymus poly(ADP-ribose) synthetase: evolutionally conserved segments and their potential functions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zinc-binding finger motifs are observed in seq. 21-51 and 128-165.
The sequences, 200-220 and 250-270, showed helix-turn-helix structure. Nucleotide-binding fold was found in seq. 890-903.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is the maize poly ADP-ribose polymerase (PARP) gene. The sequence codes a PARP with 982 amino acids (AAY28464). PARP is required in the cell in most cases of DNA repair, recombination, rearrangement and transposition. PARP gene and antisense gene can be used to transform plant cells and alter the metabolic state of the transformed cell. This is useful in enhancing disease resistance in plants and methods of genetic transformation of plants. Plants transformed with either a sense or antisense PARP nucleotide sequence may be utilized to increase transformation frequency in plant cells. The enzyme also plays a role in pathogen attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2476 aacaagatgctattatggcacggttcaaggttgacgaattttgtgggaattcttagtcaa 2535

The present sequence encodes the ZAP1 protein of Zea.mays. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The ZAP1 polymucleotide sequences can be used for modulation of programmed cell death in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous ZAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation claimts that are resistant to fungior nematodes; are male or female sterile, or have better seed-shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modulating cell death, growth and stress resistance in eukaryotes, specifically plants, used, e.g. to impart fungus or nematode resistance

The present sequence encodes the ZAP2 protein of Zea mays. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The ZAP2 polymucleotide sequences can be used for modulation of programmed cell death in plants, to induce, or protect against, programmed sell death, in plants, to induce, or protect against, programmed cell death, of which parp activity is reduced. Reducing expression of endogenous ZAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, of stress (cold, chemical treatments, pathogens, pests, drought, heat, cor during transformation). Particular applications are generation of plants that are resistant to fungion nematodes; are male or female sterile, or have better seed-shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or
Modulating cell death, growth and stress resistance in eukaryotes, specifically plants, used, e.g. to impart fungus or nematode resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2729

The present sequence encodes a NAP protein. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polynucleotide sequences can be used for modulation of programmed cell death in eukaryotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to induce, to increase growth rate and to produce plant cells that are more tolerant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungi or nematodes; are male or female sterile; or have better seed shatter properties. The methods are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modulating cell death, growth and stress resistance in eukaryotes, specifically plants, used, e.g. to impart fungus or nematode resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                used to improve growth of transformed plant cells (and derived calli or

The present sequence encodes the NAP protein of Zea mays. This protein lis a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polynucleotide sequences can be used for modulation of programmed cell death in eukaryotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant

Example 1; Page 89-92; 126pp; English.

of stress (cond, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungi or nematodes; are male or female sterile; or have better seed shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or

This invention describes a novel vector (A), suitable for gene therapy, which contains a DNA insert (I) that encodes a practically complete poly(adenosine diphosphate-ribose) polymerase (PARP) which has antitumor activity. PARP is a nuclear DNA repair enzyme (activated by strand breakage), that allows recovery of proliferating cells from the toxic effects of DNA damage (caused by alkylating or oxidizing agents or radiation), and protects cells against such damage or other causes of genomic instability. (A) are used for treatment of cancer and for cancer prevention in subjects at high risk (e.g. those with tumor-associated genetic defects). Thus cells treated with (A) show an increased tendency to die when treated with radiation or chemotherapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                   agent, and in cells that survive this treatment they inhibit genomic instability, so should reduce the likelihood of further development of both malignant cells and resistance to chemotherapy. This sequence encodes the human poly(ADP-ribose) polymerase described in the invention

The present sequence encodes a poly(ADP-ribose) polymerase (PARP) contg. a DNA-binding domain (DBD). The DNA fragment from -29 to + 1127 (nucleotides 67-1220 of this sequence) encoding the DBD can be inserted into vectors which are used for gene therapy. Over-expression of the DBD inhibits the DNA repair function of PARP, so the vectors are useful for gene therapy or tumours, esp. in combination with conventional chemo-
                                      PARP; DNA-binding domain; poly(ADP-ribose) polymerase; gene therapy;
            domain of poly(ADP-ribose) polymerase coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                οĘ

New tankyrase2 polypeptides, useful for treating conditions mediated by poly(adenosine diphosphate-ribose) polymerase activity e.g. cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different versions, designated TANKZ-LONG and TANKZ-SHORT. Tankyrase2 has polyADD-ribosylation activity and is involved in the modification of TRF1, which is a telomere-specific binding protein. The regulation of telomere length, in which FRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and

New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (poly(ADP-ribose) polymerase) cDNA. This sequence was amplified using the primers given in AAC85315-17. DNA derived from a testis cDNA ilbrary was used as a template. The protein of the invention, bPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders. hPARP2 and antibodies to it,
Sjogren's syndrome; alcoholic hepatitis; bacterial pneumonia; hypovolemic shock; Type I diabetes mellitus; hypersensitivity; leukocyte dyscrasia; thermal injury; cytokine-induced toxicity; expressed sequence tag; EST; RACE; PCR; amplify; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence represents the 3' fragment of the human parp2
                                                                                                                                                                                                                                                                                                                                                                                                                        Christenson E, Demaggio AJ, Goldman PS, McElligott DL;

```
This sequence represents cDNA encoding a novel human poly(ADP-ribose)
synthetase, sbhPARS2. The invention also relates to fragments,
variants and sequences with at least 95% identity to the sbhPARS2.

protein or nucleotide sequence; expression systems and host cells
comprising an sbhPARS2 nucleic acid sequence; the recombinant expression
of sbhPARS2; and an antibody specific for sbhPARS2. sbhPARS2 proteins
and nucleotides are useful as vaccines for inducing an immunological
response in a mammal. The sbhPARS2 protein is useful for identifying
compounds which inhibit or stimulate its activity or expression level.
Such agonists and antagonists of sbhPARS2 are useful for treating human
diseases including ischemial and ischaemic tissue injury (e.g., cerebral
and cardiac ischaemia, myocardial infarction, stroke), inflammation,
cutoimmune disease (e.g. diabetes, multiple sclerosis) and
neurodegenerative diseases (e.g., Parkinson's disease and Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human polypeptide of the polyADPribose synthetase family for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diagnostic assays and for screening modulators used for preventing and treating inflammation, autoimmune disease and Alzheimers disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /*tag= a

disease). sbhPARS2 nucleic acids are useful as diagnostic reagents for detecting mutations in the associated gene; as hybridisation probes to isolate full-length sbhPARS2 cDNAs and sbhPARS2 genomic clones; and for chromosome localisation studies. The sbhPARS2 protein is also useful as an immunogen to produce antibodies for therapeutic use. sbhPARS2 proteins, nucleotides and antibodies are also useful in screening methods for detecting the effect of added compounds on the production of mRNA and

WPI; 2001-025335/03. P-PSDB; AAB47029 New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, such as, arthritis, encephalitis, myocardial ischemia, and leukocyte metastasis

Claim 1; Page 91-93; 129pp; English.

This sequence encodes human poly(ADP-ribose) polymerase (HPARP2).

This protein causes the covalent addition of polymers of ADP-ribose
to protein targets. HPARP2 activity is induced in many instances of
oxidative stress or during inflammation where there is direct damage
to the DNA. HPARP2 may be used to identify antagonists which
may be used to treat a human having a disorder mediated by PARP2
may be used to treat a human having a disorder mediated by PARP2
or neoplastic tissue growth disorders, e.g. ischemic stroke,
cor neoplastic tissue growth disorders, e.g. ischemic stroke,

Novel genes and proteins, antibodies and binding partners useful in diagnosis and therapy of energy deficiency associated disease conditions -

Claim 7a; Page 49-52; 96pp; German.

This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
solution with a functional NRD⁺-binding site and no zinc finger
sequence motif, of general formula CX_ZCX_ZMHX_ZC (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
C PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
founding necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence encodes the
human PARP2 protein used in the method of the invention.
